House Prices | Exploratory Data Analysis

Kaggle House Prices dataset • Student summary

Overview

I explored the house prices dataset to better understand how sale prices vary and which house features seem to be related to price. I used Python, pandas, Matplotlib and Seaborn to check the data and create a few simple graphs.

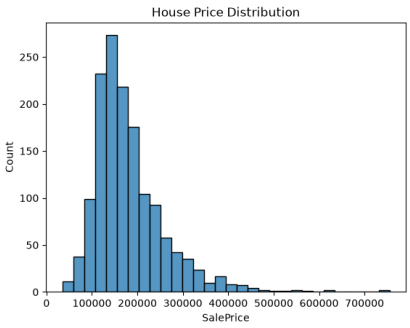

Dataset at a glance

Houses	Variables	Mean sale price	Median sale price
1,460	81	$180,921	$163,000

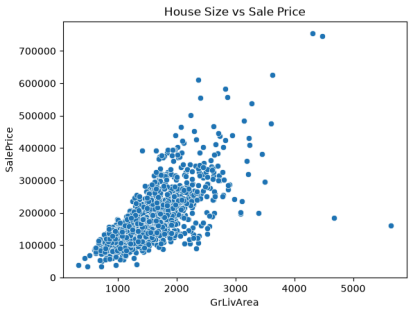

Data check: I found no duplicate rows. Some columns have missing values, especially PoolQC, Alley, Fence and MiscFeature.

What the graphs show

Sale price distribution

Living area vs. price

Average price by quality

Key findings

- Most homes are in the lower and middle price ranges, while a smaller number sell for much more.
- Larger living areas generally go together with higher sale prices, although there are exceptions.
- Homes with higher overall quality ratings tend to have higher average sale prices.

Conclusion

From these graphs, house size and overall quality seem to be useful features for understanding sale prices. This was a first look at the data, so I would explore more variables before making stronger conclusions.
